Application No.: 09/911,017 PATENT

IN THE CLAIMS

A status of all the claims of the present Application is presented below:

1. (original) A method for storing scene detection information, comprising: identifying scene candidates from received video data;

formatting the scene candidates for storage on optical storage media, the optical storage media having a recordable capacity; and

storing the formatted scene candidates on the optical storage media in a media structure without reducing the recordable capacity.

- 2. (currently amended) The method of claim 1, wherein the formatting is performed utilizing one of the group consisting of [VOB] <u>Video Object Format (VOB)</u> and [UDF formats] <u>Universal Disc Format (UDF)</u>.
- 3. (original) The method of claim 1, further comprising receiving video data from one of the group consisting of a video camera, video recorder, and a digital data stream.
- 4. (original) The method of claim 1, wherein the media structure comprises disc control blocks on the optical storage media.
- 5. (original) The method of claim 1, further comprising indexing the scene candidates after storing the scene candidates.
- 6. (original) The method of claim 1, wherein formatting includes indexing the scene candidates into a menu system.

7. (original) A system for storing scene detection information, comprising: a processing module;

scene detection information storage logic operatively associated with the processing module and operable to receive video data;

identify scene candidates from the video data; and

format the scene candidates for storage on an optical storage medium, the optical storage medium having a recordable capacity; and

a media storage system operable to store the formatted scene candidates on the optical storage medium in a media structure without reducing the recordable capacity.

- 8. (currently amended) The system of claim 7, wherein the scene candidates are formatted utilizing one of the group consisting of [VOB] <u>Video Object Format (VOB)</u> and [UDF formats] <u>Universal Disc Format (UDF)</u>.
- 9. (original) The system of claim 7, wherein the video data is received from one of the group consisting of a video camera, video recorder, and a digital data stream.
- 10. (original) The system of claim 7, wherein the media structure comprises disc control blocks on the optical storage medium.
- 11. (original) The system of claim 7, further comprising indexing the scene candidates after storing the scene candidates.
- 12. (original) The system of claim 7 wherein the formatting includes indexing the scene candidates into a menu system.
- 13. (original) The system of claim 7 wherein the logic is implemented using software residing on a computer-readable medium.

14. (original) A system for storing scene detection information, comprising: a processing module; and

scene detection information storage logic operatively associated with the processing module and operable to receive video data;

identify scene candidates from the video data;

format the scene candidates for storage on an optical storage medium, the optical storage medium having a recordable capacity; and

cause the formatted scene candidates to be stored on the optical storage medium without reducing the recordable capacity.

- 15. (currently amended) The system of claim 14, wherein the scene candidates are formatted utilizing one of the group consisting of [VOB] <u>Video Object Format (VOB)</u> and [UDF formats] <u>Universal Disc Format (UDF)</u>.
- 16. (original) The system of claim 14, wherein the video data is received from one of the group consisting of a video camera, video recorder, and a digital data stream.
- 17. (original) The system of claim 14, wherein the formatting includes indexing the scene candidates into a menu system.
- 18. (original) The system of claim 14, wherein storing is performed using disc control blocks on the optical storage medium.
- 19. (original) The system of claim 14, wherein the logic is implemented using software residing on a computer-readable medium.
- 20. (original) The system of claim 14, wherein the logic is further operable to generate a list of scene candidates.
